

Tests are currently executable and repeatable

Unit: unit test for product is currently executable.

UI testing: The UI test is currently being worked on. The minimal click currently is 6 clicks but it is not consistent on all the pages, so we are currently working on it. Also, a customer cannot cancel a transaction, the seasonal sales is not working at the moment. We are also working on the consistency almost all pages for the user interface testing.

Validation: Validation testing is also not completed. We plan to let a customer to purchase at most 5 products at a time. Also, we will be trimming username entry to prevent creating space in usernames.

Requirements Testing: All user case specifications are completed now expect customer cancelling of transactions, admin removing and adding of products.

Basis Path (BP): We have not completed the basis path testing. We plan to use the number of purchases a customer to make at a particular transaction.

Equivalence Partition (EP): We have not completed testing yet.

Below is the latest version of the project:
